1 SCOPE

The aim of this document is to provide technical requirements for the supply of concentric –lay-stranded bare conductors to be used in the HV and MV overhead electrical distribution lines of the Enel Group Distribution Companies, listed below:

| | |
|--------------------------------|------------------|
| <i>Codensa</i> | <i>Colombia</i> |
| <i>Enel Distribución Perú</i> | <i>Perú</i> |
| <i>Edesur</i> | <i>Argentina</i> |
| <i>e-distributie Banat</i> | <i>Romania</i> |
| <i>e-distributie Dobrogea</i> | <i>Romania</i> |
| <i>e-distributie Muntenia</i> | <i>Romania</i> |
| <i>e-distribuzione</i> | <i>Italy</i> |
| <i>e-distribución</i> | <i>Spain</i> |
| <i>Enel Distribución Chile</i> | <i>Chile</i> |
| <i>Enel Sao Paulo</i> | <i>Brazil</i> |
| <i>Enel Distribuição Ceará</i> | <i>Brazil</i> |
| <i>Enel Distribuição Rio</i> | <i>Brazil</i> |
| <i>Enel Distribuição Goiás</i> | <i>Brazil</i> |

This standard specifies the electrical and mechanical characteristics and test requirements that must be accomplished by concentric lay stranded bare conductors made from round wires for use as overhead electrical conductors and ground wires by the utilities mentioned above.

This standard replaces all the local standards used up to now by all the Distribution Companies, as long as local regulation allows it.

2 LIST OF CONDUCTORS

This standard includes round wire concentric lay bare overhead electrical conductors stranded in alternate directions, with or without grease, of one of the following types:

- Type ACSR: Concentric-lay-stranded hard drawn aluminum conductors, zinc-coated-steel reinforced.

Aluminum wires: AL1 (EN60889) or 1350-H19 (ASTM B230).

Zinc coated steel wires: ST1A (EN50189) or Class A (ASTM B498)

- Type ACSR/AW: Concentric-lay-stranded hard drawn aluminum conductors, aluminum-coated-steel reinforced.

Aluminum wires: AL1 (EN60889) or 1350-H19 (ASTM B230).

Aluminum clad steel wires: A20SA (EN61232) or Class AW3 (High Strength) (ASTM B502)

| | | |

|  | GLOBAL STANDARD | Page 4 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

•Type AAAC: Concentric-lay-stranded aluminum alloy conductors

Aluminum wires: AL3 (EN50193) or 6201-T18 (ASTM B398).

•Type CC: Conductors made from round medium-hard copper wires as indicated on UNE207015 or ASTM B8.

•Type AC: Zinc coated steel wires strand specifically intended for use as overhead ground wires as indicated on ASTM A363.

•Type ARLE: Aluminum clad steel wire strand specifically intended for use as overhead ground wires as indicated on EN50182 or ASTM B416.

The list of conductor with the main requirements, which is an integral part of the present document, is reported in the GS Type Code List attached. In the following tables are shown a brief of these requirements:

Table 1 - Concentric-Lay-Stranded Aluminum Conductors, Coated-Steel Reinforced

3 REFERENCE LAWS AND STANDARDS

The list of reference laws and standards used to develop this specification and that shall be used as test method are mentioned below in this document

3.1 International Standards

IEC 60050-466 International Electrotechnical Vocabulary (IEV) - Part 466: Overhead lines

IEC-TR 61597 Overhead electrical conductors - Calculation methods for stranded bare conductors

EN 50182 Conductors for overhead lines - Round wire concentric lay stranded conductors

EN 50183 Conductors for overhead lines — Aluminium-magnesium-silicon alloy wires

EN 50189 Conductors for overhead lines — Zinc coated steel wires

EN 50326 Conductors for overhead lines - Characteristics of greases.

EN 60889 Hard-drawn aluminium wire for overhead line conductors.

EN 61232 Aluminium-clad steel wires for electrical purposes.

EN 61394 Overhead lines - Requirements for greases for aluminium, aluminium alloy and steel bare conductors

ASTM B230 Standard Specification for Aluminum 1350-H19 Wire for Electrical Purposes.

ASTM B232 Standard Specification for Concentric-Lay-Stranded Aluminum Conductors, Coated-Steel Reinforced (ACSR).

ASTM A363 Standard Specification for Zinc-Coated (Galvanized) Steel Overhead Ground Wire Strand

ASTM B398 Standard Specification for Aluminum-Alloy 6201-T81 Wire for Electrical Purposes.

ASTM B399 Standard Specification for Concentric-Lay-Stranded Aluminum-Alloy 6201-T81 Conductors.

ASTM B498 Standard Specification for Zinc-Coated (Galvanized) Steel Core Wire for Aluminum Conductors, Steel Reinforced (ACSR).

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------------|---------------------------------------|
|  | GLOBAL STANDARD | Page 8 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

ASTM B500 Standard Specification for Metallic Coated Stranded Steel Core for Aluminum Conductors, Steel Reinforced (ACSR).

ASTM B502 Standard Specification for Aluminum-Clad Steel Core Wire for Use in Overhead Electrical Aluminum Conductors

ASTM B2 Standard specification for medium-hard-drawn copper wire.

ASTM B8 Standard specification for concentric-lay-stranded copper conductors, hard medium-hard, or soft.

3.2 List of replaced Standards

See local section

3.3 Local Standards

See local section

4 TERMINOLOGY

In addition to IEC 60050-466 terminology, the following ones shall be noted:

Direction of lay: The direction of lay is defined as right-hand or left-hand. With right-hand lay, the wires conform to the direction of the central part of the letter Z when the conductor is held vertically. With left-hand lay, the wires conform to the direction of the central part of letter S when the conductor is held vertically;

Lay ratio: means the ratio of the axial length of one complete turn of the helix formed by the the wire of a stranded conductor to the external diameter of the corresponding layer of wires;

Nominal: the name or identifying value of a measurable property by which a conductor or component of a conductor is identified ant to which tolerance are applied. Nominal values should be target values;

Wire: a filament of draw metal having a constant circular cross-section;

Rated Tensile Strength: sum of the tensile strength of all wires considering the rupture load of the weakest wire.

5 DESIGN AND MANUFACTURE

5.1 RAW MATERIALS OF WIRES

The following sections provides general information about the raw material of wires considered in this Global Standard.

5.1.1 Zinc-Coated (Galvanized) Steel Core Wires

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------------|---------------------------------------|
|  | GLOBAL STANDARD | Page 9 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

Zinc-Coated (Galvanized) Steel Core Wires used for mechanical reinforcement in the manufacture of aluminum conductors, must be manufactured with the requirements of the standards EN50189 (Type ST1A) or ASTM B498 (Class A).

5.1.2 Aluminum-Coated (Aluminized) Steel Core Wires

Aluminum-Coated (Aluminized) Steel Core Wires used for mechanical reinforcement in the manufacture of aluminum conductors, must be manufactured with the requirements of the EN 61232 (“20SA” class and “A” type) or ASTM B502 (wires Class AW3 -High Strength).

5.1.3 Aluminum Wires

Aluminum wires used to assemble the bare conductors considered in this Global Standard shall be made of pure aluminum, manufacture under the standards EN 60889, or aluminum 1350-H19, manufacture under the standard ASTM B230.

5.1.4 Aluminum-Alloy Wires

Aluminum-alloy wires used to assemble the bare conductors considered in this Global Standard shall be made of 6201-T81 aluminum-alloy under the standard ASTM B398 or identified as AL3 under the standard Norma EN 50183.

5.1.5 Copper wires

Copper wires shall be uncoated, under the standards ASTM B2 or UNE 207015.

5.2 CONSTRUCCIÓN

The following sections provides the description of the conductors in function of the wires use to assemble them. The Standards use to manufacture the conductors are indicated in the Common List and in the section 2.

5.2.1 Aluminum Conductors, Zinc-Coated-Steel Reinforced

Aluminum conductors, coated-steel reinforced are assembled with aluminum wires (see 5.1.3) in the external layers and zinc-coated (galvanized) steel core wires in the internal layers (see 5.1.1). Manufactured as indicated on EN 50182 or ASTM B233.

5.2.2 Aluminum Conductors, Aluminum-Coated-Steel Reinforced

Aluminum conductors, aluminum-coated-steel reinforced are assembled with aluminum wires (see 5.1.3) in the external layers and aluminum-coated (Aluminized) steel core wires in the internal layers (see 5.1.2).

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------------|---------------------------------------|
|  | GLOBAL STANDARD | Page 10 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

Manufactured as indicated on EN 50182 or ASTM B549.

5.2.3 Alloy-aluminum conductors

The alloy-aluminum conductors shall be assembled with alloy-aluminum wires, as indicated in the section 5.1.4. and manufactured as indicated on EN 50182 or ASTM B399.

5.2.4 Copper conductors

The uncompressed copper conductors shall be assembled with copper wire, as indicated in the section 5.1.5. and manufactures as indicates on ASTM B8 or UNE207015.

5.2.5 Steel Overhead Ground Wire Strand

The coated steel conductors shall be assembled with galvanized or aluminum-clad steel wires, as indicated in the section 5.1.1. and 5.1.2. Galvanized ground wires shall be manufactured as indicated on ASTM A363 and aluminum-clad ground wires as indicated on EN50182.

5.2.6 Greases

The Concentric-Lay-Stranded Aluminum Conductors, Aluminum-Coated-Steel Reinforced and Alloy-Aluminum Conductors could be provided with or without greases, applied to the both internal or external layers (see Figure 1), as indicated in the GS Type Code List.

The grease shall be chemically neutral with respect to aluminum, zinc and steel, free of impurities, uniform throughout of length of the conductor and cold applied (Type A). It must have the characteristics described in the standards EN 50326 or IEC 61394 for a designation 30A125. and the stability under short-circuit must be tested with 250 °C for 1,5 seconds.

Figure 1 – Greased Conductors.

The volume and mass of the grease shall be calculated as indicated on Annex B from EN-50182. Special conditions other than that could be specified on Local Sections or specific orders.

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------------|---------------------------------------|
|  | GLOBAL STANDARD | Page 11 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

5.3 SURFACE

The surface of the conductor shall be free from all imperfections visible to the unaided eye (normal corrective lenses accepted), such as nicks, indentations, etc., not consistent with good commercial practice.

5.4 Conductor diameter

The diameter of the conductor shall not vary from the nominal values more than the limits indicated in the referenced standards.

5.5 Stranding

All wires of the conductor shall be concentrically stranded.

Adjacent wire layers shall be stranded with reverse lay directions.

The directions of lay of the external layer shall be “right-hand” (Z) to conductors type ACSR, ACSR/AW, AAAC and ARLE.

The directions of lay of the external layer shall be “left-hand” (S) to conductors type AC.

The direction of lay of the external layer to copper conductor shall be “right-hand” or “left-hand”, as indicated in the GS Type List.

The wires in each layer shall be every and closely stranded around the underlying wire of wires.

5.6 Joints

Conductors with only one steel wire, shall not be made any joints after heat treatment of wires or rods. There shall be no joints of any kind made in the zinc-coated or aluminum-coated steel core wire or wires during stranding.

Before stranding, no more than one joint shall be accepted in the aluminum wires per length of conductor. During stranding, no wire welds shall be made for the purpose of achieving the required conductor length.

Joints are permitted in aluminum or copper wires unavoidably broken during stranding, provided such breaks are not associated with either inherently defective wire or with the use of short lengths of wires. Joints shall conform to the geometry of original wire, i.e., joints shall be dressed smoothly with a diameter equal to that of the parent wires and shall not be kinked. Joints shall not be made in the finished copper wires composing conductors of seven wires or less.

Joints in wires shall not be closer than 15 m from a joint in the same wire or in any other wire of the completed conductor. The quantity of joints per length shall not be greater than values indicated in the standards of reference.

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------------|---------------------------------------|
|  | GLOBAL STANDARD | Page 12 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

Joints shall be made by electric butt welding, electric butt cold upset welding or cold pressure welding and other approved methods. These joints shall be made in accordance with good commercial practice. The first type of joints shall be electrically annealed for approximately 250 mm on both sides of the weld.

5.7 Mass per unit of length

The mass per unit length of the conductor shall be calculated using densities, stranding increments and cross-sectional areas of all kind of wires. The mass per unit length of the conductor without grease shall not vary from its nominal value by more than $\pm 2\%$.

The mass per unit length of the grease on greased conductors shall not vary from its nominal value by more than $\pm 20\%$.

5.8 Rated tensile strength

Rated tensile strength are result of sum of the tensile strength of all wires that compose the conductor, as indicated in the referenced standards shown in the GS Type Code List.

5.9 Electrical resistance

The electrical DC resistance at 20 °C of a conductor, expressed in Ω / km and with three decimals, is calculated using the value of the resistivity of the wires used.

6 TESTS

6.1 Type Test

Type test shall be carried out over conductors considered in this Global Standard in order to verify its main characteristics that depended mainly on its design.

Each manufacture shall make these tests once for a new design or manufacturing process of conductor and the subsequently repeated only when the design or manufacturing process is changed. The type test shall be analyzed by the purchaser using the requirements of this Global Standard and requirements of homologation procedures.

Type tests of wires and conductors of type ACSR, ACSR/AW, AAAC, AC and ARLE shall be carried out as the procedures of EN50182 and are shown in the table below. Additional test could be indicated in Local Section.

| Type Tests | | Clause EN50182 |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Conductor | <ul style="list-style-type: none"> - surface condition - diameter - inertness - lay ratio and direction of lay - number and type of wires - mass per unit length - stress-strain curve - tensile breaking strength - stringing test | 6.4.1 6.4.2 6.4.3 6.4.4 6.4.5 6.4.6 6.4.7 6.4.8 6.4.9 |

| | - alternative bends | 9.3.2 |
| | - resistivity | 9.4.1 |
| | - torsion | 9.3.3 |
| | - welding | 7 |

6.2 Sample test

Sample test shall be carried out to guarantee the quality of conductors and compliance with the requirements of this standard. Shall be informed in the purchase order about the presence of a inspector as representative of the purchaser during the sample tests

The list of sample tests of wires and conductors are shown in the Local Section and shall be carried out as the procedures of referenced standards.

7 CONDITIONS OF SUPPLY

The conductor shall be suitably protected against damage which could in ordinary handling and shipping. The reel shall be protected with staves or similar protection

The reel shall be capable to supporting the weight of the conductor both during and after transport, by truck, crane movements or forklift truck, without cause damage to the conductor.

The drum bore shall be capable to supporting the weight of the conductor and respect the minimum bend radio.

The reel shall be loaded and unloaded by crane capable to support its weight.

These ends internally secured to the spools, must be mechanically protected against possible damages resulting from handling and transportation of each spool, leaving both ends accessible through the use of an internal helix or reel on each spool.

Specific characteristics are detailed in Local Section.

| | | |

|  | GLOBAL STANDARD | Page 15 of 31 |
| | CONCENTRIC-LAY-STRANDED BARE CONDUCTORS | GSC003 Rev. 3 15/12/2020 |

8 PACKING AND MARKING

Each reel shall be identified with an indelible and easily legible mark on the external faces, as indicated in the Local Section

9 LENGTH TOLERANCE

The admitted tolerance for a size is equal to $\pm 5\%$ of the length indicated in the order. The equipment used to measure the length of the conductor shall be accurate to $\pm 1\%$.

10 Warranty

Requirement of warranty will be indicated the moment of request for bids it, indicating periods and standards.

Values of DC Resistance, Mass per unit length, Rated Strength, Coefficient of linear expansion and Final Modulus of elasticity presented on the tables above are calculated values using the method indicated on relevant standard and IEC-TR 61597.

Nominal values specified on the local sections or a specific order could present some variation from the indicated values, with a deviation no greater than $\pm 2\%$ of the value indicated.

| 7 | CONDITIONS OF SUPPLY | The conductors shall be supplied with reel as indicated in the standard UNE 21045:1974. |
| 8 | PACKING AND MARKING | <p>Each reel shall have, in each of the outer surface, an identification plate, weatherproof, with the inscription "ENEL / ENDESA" and the following information:</p> <ul style="list-style-type: none"> • Name of the manufacturer • Conductor type • Cable length, in meters. • Purchase Order N° • Number of the spool within the delivered batch. • Description of this standard • Manufacture year • Direction of rotation of the coil (with a arrow). • Unwinding direction (if the reel was packaged). • Net weight and gross weight in kg. |

C ENEL DISTRIBUZIONE (Italy), ENEL DISTRIBUTIE: Banat, Dobrogea, Muntenia (Romania)
